## Why the Mystery?

Why Shouldn't You Know What Is in a Good Lawn Grass Seed Mixture Before You Buy It You Should Know What You Are Buying

- FACT 1 The more Certified Illahee Creeping Fescue and Kentucky Blue Grass a mixture contains, the better the mixture.
- FACT 2 Both are Perennials and live indefinitely. However, they require two or three years to reach full maturity.
- FACT 3 Meanwhile they need quick-growing Red-Top and Rye Grass as nurse crops to shade them in their early growth.
- FACT 4 Your first year s lawn is mostly Red Top and Rye Grass.
- FACT 5 After a few years, Certified Illahee Creeping Fescue and Kentucky Blue Grass will be at their best; they form the permanent lawn.

### BUILD LAWNS IN POOR SOILS WITH BURNETT-SEEDSMEN'S "POORSOIL LAWNMIX"

**Drouth Resistant grasses** is the answer to establishing a lawn in poor, sandy soils, for the same reason that camels, not horses, are used in the desert. - - So, Burnett-Seedsman have selected the best drouth grass, namely, **Creeping Red Fescue** (Illahae strain). Because of it's tolerance of drouth, Illahee is especially adapted to dry, sandy or gravelly soils—poor or rich. Illahee Creeping Red Fescue produces a deep rooted sod that withstands tramping and abuse. It spreads out, carpet-like, by means of underground rootstocks and overground stems. The grass blades are rich green, fine, smooth and soft; they stay green when other grasses brown and sear in Summer. Illahee is disease resistant; stands close cutting; grows in sun or shade and reaches full maturity in two years. It grows well with **Highland Bent**, also included in **Burnett-Seedsman's Poorsoil Lawnmix**. **Highland Bent's** growth habit somewhat parallels Illahee Fescue, especially being able to withstand adverse conditions of climate and low soil fertility. To these two permanent grasses is added a small percentage of domestic Rye Grass which acts as a nurse crop. **Burnett-Seedsman's "Poorsoil Lawnmix"** contains 75% Illahee Fescue, 5% Highland Bent and 20% domestic Rye grass, by weight.

### NEW BLUE GRASS . . . MERION B-27

Although Kentucky Blue grass makes the finest lawn carpet, it does not grow well in warm climates and in poor, sandy soils, and is subject to disease, which slowly kills it off. A new strain, **Merion B-27** has been developed that is **disease resistant** and does well everywhere. Only handfuls are available.

# About Your Lawn

## SOW The Best GRASS SEED MIXTURES ON The Best SOILS Only

"The better the Lawn Grass Seed Mixture used, the better the lawn produced." That is true only if you bear this in mind, "The better the soil planted, the better the lawn produced." One without the other means a waste of time and money. Both requirements are necessary for a **permanent** lawn.

## WHAT IS MEANT BY BETTER SOILS?

The deeper the top-soil (friable loam, a handful crumbles when palm is opened) the better the soil. The deeper the top-soil, the deeper will grass roots penetrate. The deeper the grass roots go into the ground, the better the chances of grass surviving Summer droughts. Clay soil or hard pan bakes after a rain preventing grass roots from breathing. Sandy soil is so porous, rain and moisture leach rapidly out of the ground. These two types of soil must be replaced or converted into loam, the deeper the better.

## HOW TO CONVERT CLAY OR SANDY SOILS?

It takes time. The more patient you are, the more successful you will be. If you forego an entire growing season by planting a succession of cover crops you will not regret it. Rye, Winter Vetch, Soy Beans, Cow Peas and Crimson Clover are excellent cover crops. All except clover sow at the rate of 5 lbs. per 1000 sq. ft. clover, but 1 lb. per 1000. Rye seed produces an abundance of greens. The other four being legumes bring nitrogen into the soil by extracting it from the air. Start with Rye seed. Sow broadcast. Rake lightly and cover an inch or so of Peat Moss. After a few months when growth has reached a height of one foot or more, turn under. Be sure and bury the stalks as well as the roots. Spread Agrico Lawn fertilizer 25 lbs. to every 1000 sq. ft. Now sow any one of the other four crops, rake, cover with Peat Moss. When high enough turn under, fertilize. Repeat this process as often as desired.

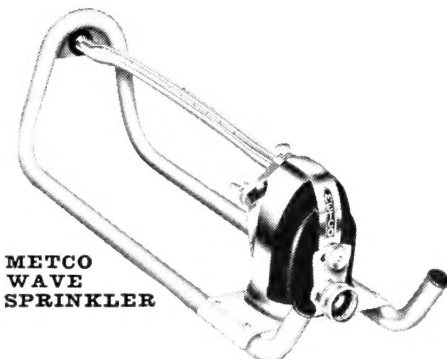

### SALEM FERTILIZER SPREADER (see page 33)

Remember the more crops planted and buried the deeper the top-soil becomes. You can stop the plantings when you reach either of the two best lawn seeding periods September or April. For Fall planting use either Rye or Winter Vetch and spade under in the Spring. Only these two will winter over.

## BEWARE IN BUYING TOP-SOIL

The best top-soils sold contain innumerable weed seeds. You won't notice them until the lawn comes up. Keep in mind, the cheapest lawn grass seed mixture does not contain weed seeds of Dandelion, Crab Grasses or Plantain. Weeds get into your lawn through top-soil, manure or are blown in. If you want to buy soil improving material, purchase Peat Moss, Humus, Cow Manure, Driconure or Bovung. These materials carry the least if any weed seeds. Only a few inches of improved top soil are insufficient to maintain a permanent lawn.

## FINAL PREPARATIONS OF SOIL

After turning under the last cover crop, allow a few weeks time for it to rot, and for the ground to set. Test soil for fertility deficiency by using a soil testing kit or mailing a sample to your state Agricultural Exper. Station. Add the recommended quantity and quality of fertilizer, and rake in thoroughly. Rake and roll the ground, being careful not to leave any depressions or gullies into which rain will accumulate and sour. Your last step is to rake smooth of stones and slope very slightly to allow excess rains to flow off.

## SEEDING THE LAWN (lb. sows 200 sq. ft.)

Using the handle of your rake as a marking stick, divide the area into several sections. In sowing each boxed section your eyes will be confined and not wandering which makes for more thorough sowing. If you use a fertilizer and grass seed spreader, this dividing is not necessary. After the entire area has been sown, rake lightly by drawing the rake towards you. Since raking is for the purpose of making ridges into which the seed drops and soil falls on top of it, be careful to not let the teeth of the rake go too deep into the soil. To do so, you would draw the soil away in spots leaving them unseeded. To avoid this, grasp the end of handle with the right hand and the underside of the middle of the rake with the left hand. This is the best method for covering the seed. Do not scatter soil over the seed. This method makes too uneven a covering. After raking, roll the ground lightly. If a roller is unavailable, lay a plank board on lawn and step on it or use a sod tamper. Rolling or tamping the seed is important. By so doing you pack the seed into the soil, eliminating all air pockets. This makes for better germination. The last step is to water the lawn with a fine sprinkler or nozzle unless you are fortunate to have a rain fall immediately after you have completed the job.

(see page 33 for prices)

## LATER CARE OF THE LAWN

When the first good growth of grass has appeared, do not cut it. Instead, roll it lightly. These grass seedlings in breaking through the ground push up the soil. Rolling repacks the soil. After a few days you can mow the lawn without danger of pulling out the grass. Any time you dig out a weed, be sure and sow a little grass seed in that spot. Keep the soil covered with grass at all times. Weeds are blown on your lawn daily by the thousands. Many of them sprout. If they cannot touch soil, they wilt away and die. There are many chemicals for killing weeds in lawns, Zotox, 2-4-D and "Tat-C-Lect". Some report success with them. Top-dress your lawn twice a year, Spring and Fall, preferably before a rain.

## Asters (Wilt Resistant)

Need no introduction, but what is **Wilt Resistant Aster Seed**? It's a strain of seed produced from plants that were grown in heavily wilt-infested soil. It is reasonable to infer that if a strain was able to grow to full maturity and bear seed, it's genera or offspring must likewise be immune to wilt. Don't take chances, sow **Wilt Resistant Strain Asters** wherever possible.

**Asters prefer rich sandy or loamy soil.** Use well rotted manure or phosphate fertilizer. Cultivate and water regularly. Sow seeds six weeks before intended transplanting; water immediately after. Set tall varieties 18 in. apart, medium sorts 12 in. apart, dwarf types 9 in. apart.

Pennlake (Summer Header)

## Lettuce

Although lettuce is easy to grow, it should be grown quickly in rich moist soil to be crisp and tender. Sow in a hot-bed in Feb.-March, transplanting to open ground 12 in. to 15 in. apart, in rows 18 in. apart. Make successive sowings to August. Cultivate and water thoroughly. Remember lettuce does best during cool weather.

### "EASY-TO-HEAD"

#### SENSATIONAL NEW LETTUCES

They Head in **Hot Weather**

**Pennlake.** (B.M., A.A.S., '49). A smaller heading, more refined Great Lakes, without the prominent mid-ribs; remarkably resistant to heat and tip-burn. The ideal family sized head.

Pkt. 25c; ½ oz. 60c; oz. \$1.00

**Premier Great Lakes.** (B.M., A.A.S., '49). Earlier, larger, solid headed Great Lakes, that is more resistant to tip burn; attractive foliage.

Pkt. 25c; ½ oz. 60c; oz. \$1.00

**Great Lakes** (B.M., A.A.S., 1944). Imperial type. The best Summer lettuce to date, being remarkably resistant to heat drought and tip-burn. Being slow-in-going-to-seed, it insures heads, even in hot weather and by the amateur, too. Its crispy, thick leaves fold well over solid heads, which when unraveled make desirable salad pieces; most delicious.

Pkt. 25c; ½ oz. 50c; oz. 90c

**Bibb** (57 days). Rather small head used as forcing lettuce in the South and shipped to Northern hotels where it has a reputation for excellent quality. Leaves smooth, dark green, bleaching to a rich yellow. . . . . Pkt. 15c; oz. 75c

**Big Boston (Select).** Most widely used variety with light green hard heads of superior quality; edges tinged brown.

Pkt. 10c; oz. 50c; ¼ lb. \$1.50

**Iceberg.** Large, hard, crumpled heads, white centered; leaves broad, crisp, wavy, light green, tinged brown; quality good.

Pkt. 15c; oz. 60c; ¼ lb. \$1.75

**Imperial 847.** Summer heading, undoubtedly the crispest and hardest, proven by Cornell and other tests; medium heads, long, well folded leaves; New York or Iceberg type.

Pkt. 15c; oz. 60c; ¼ lb. \$1.75

**May King.** The earliest heading lettuce; medium-small, round and firm; light green, tinged brown leaves; interior rich golden-yellow; buttery and of splendid quality. . . . . Pkt. 10c; oz. 50c; ¼ lb. \$1.50

**New York No. 12.** A heat resister which does well in mid-Summer; crisp, dark green heads with slightly curled outer leaves. Large, tightly folded cabbage-like heads are well blanched; sweet.

Pkt. 15c; oz. 60c; ¼ lb. \$1.75

## LETTUCE

Pkt. 25c; ½ oz. 40c; oz. 75c

**Early Curled Simpson.** A fine quality, hardy, early, loose leaf variety. Large compact, firm plants; sweet, crisp, tender and of good quality.

Pkt. 10c; oz. 40c

**MATCHLESS.** One of the easiest Summer varieties to grow; a cross between heading and cos types, forming loose-leaved heads of great delicacy and flavor that are highly heat resistant.

When in doubt as to what variety to sow, select Matchless. It is without doubt the best tasting of the loose leaf varieties, and comparable to the best of the heading sorts. If you can't get lettuce to head up, sow Matchless; it tastes just as good, and no worry about bolting.

Pkt. 25c; oz. \$1.00

**Oak Leaf** (40 days). This novel variety excels in ability to withstand hot weather without turning bitter. Its leaves are small, tender, and deep green, testifying to their richness in vitamins. It has a superior butter-type flavor.

Since different plants require different treatment, Hormodin Powder has been developed in three strengths, paralleling the range of hormones in nature.
